1. Introduction

This documentation provides an overview of a web application consisting of a backend built with Express.js and a frontend built with React. The application serves as a basic login system with different user roles and includes functionality for retrieving attendance data, activity assignments, and more.

2. Backend

Technologies Used

- Node.js
- Express.js
- MySQL or any other relational database
- Axios for making HTTP requests

Project Structure

The backend project structure follows a modular pattern:

- models: Contains modules for different functionalities e.g., login, attendance, activity_assignment.
- routes: Defines Express routes that use the modules from the models.
- index.js: Entry point for the server, sets up Express, middleware, and listens on a specified port.

Database Setup

1. Set up a MySQL database.
2. Configure the database connection in `models/db.js`.

API Endpoints

1. POST /login
 - Endpoint for user authentication.
 - Accepts registration number and date of birth.
 - Returns a success message and user data if authentication is successful.
2. POST /attendance
 - Retrieves attendance data for a given registration number.
3. GET /activity-assignment
 - Retrieves activity assignment data.
4. POST /insertStudent
 - Inserts new student details into the database.
5. POST /updateAttendance
 - Updates attendance status based on the provided data.
6. POST /insertActivityAssignment
 - Inserts new activity assignment data into the database.

3. Frontend

Technologies Used Frontend

- React
- Axios for making HTTP requests
- React Router

Project Structure Frontend

- components: Contains React components for different pages e.g., LoginPage, HomePage, AdminHome.
- App.js: Entry point for the frontend, defines routes using React Router.

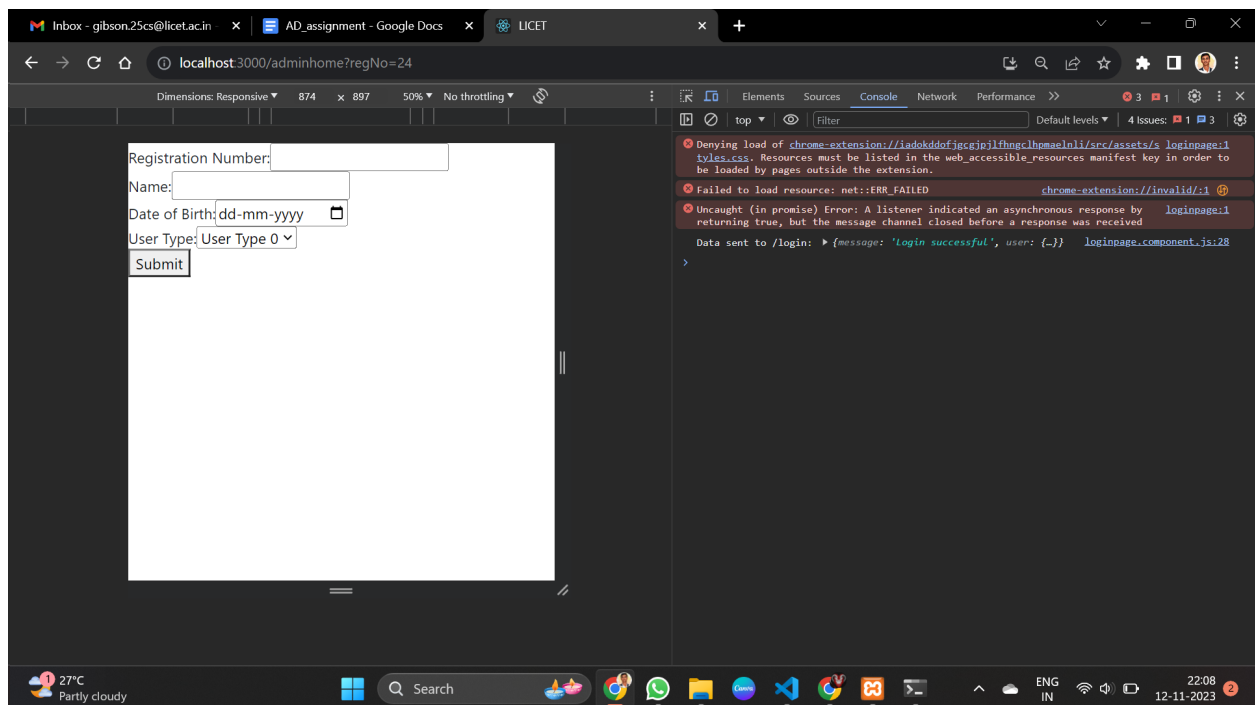

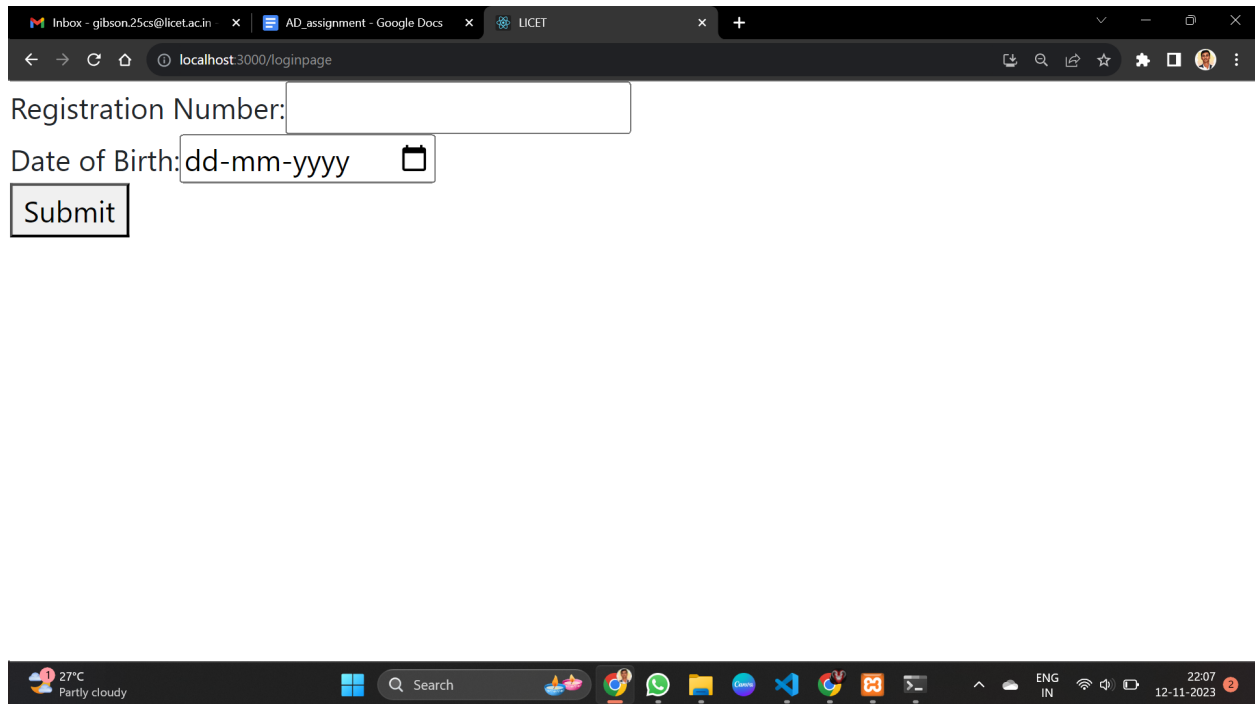

Components

1. LoginPage
 - Handles user authentication.
 - Sends a POST request to the backend with login data.
 - Redirects users to different pages based on their roles.
2. HomePage
 - Displays attendance data for the logged-in student.
3. AdminHome
 - Displays activity assignment data for an admin.

Routing

The frontend uses React Router for navigation:

- `/loginpage``: Displays the login page.
- `/homepage``: Displays attendance data for a student.
- `/adminhome``: Displays activity assignment data for an admin.
